CONVERSATIONAL INTERFACE FOR RESIDENTIAL AUTOMATION

PROBLEM STATEMENT

Smart homes are no longer futuristic, they're real and functional. However, a major issue is the lack of compatibility among devices, each requiring separate apps, leading to confusion and inconvenience. This fragmented experience often drives users back to traditional switches, which are faster and more intuitive. In India especially, this complexity discourages adoption of smart devices, making conventional homes the preferred choice.

SOLUTION

CIRA (Conversation Interface for Residential Automation) is a smart home prototype that controls lights, AC, and doors via a single voice and touch-enabled app. It automates actions like adjusting light intensity, setting AC temperature, and opening doors based on presence, with fast responses through asynchronous web services.
